

Climate change is the most important issue facing our world today. China and the United States, as the world's two largest economies and greenhouse gas polluters, share prominent roles in developing and implementing future international climate change mitigation strategies. Moreover, public support for action in these two important countries will likely be a significant factor regarding if/when climate change policies will be enacted. These two publications come from 2013 survey data on public views about climate change from American and Chinese citizens. This work was funded by Blugold Commitment funds from several UW-Eau Claire programs.

Examining Differences in Public Opinion on Climate Change between College Students in China and the United States

*Journal of Environmental Studies and Sciences*

Support for an International Climate Change Treaty among American and Chinese Adults

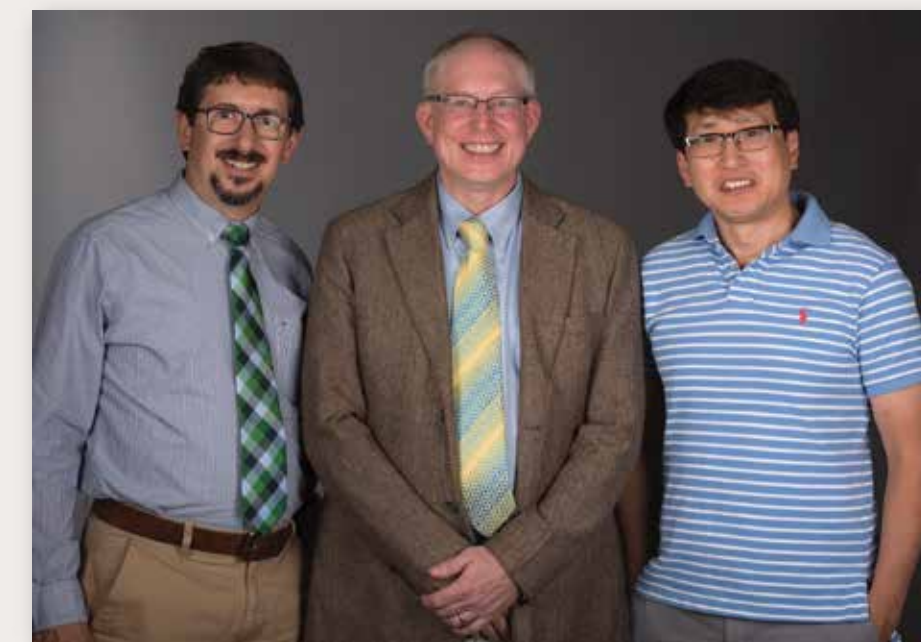

*International Journal of Climate Change: Impacts and Responses*
